

Semantic Bridge Expansion : PDP-11 /70

I've expanded the SemanticBridge dataset with a high-value diagnostic SOP for the PDP-11 /70, one of the most powerful and widely used 16-bit systems in the legacy ecosystem

SOP-PDP11 -002 Memory Parity Error Isolation

This SOP provides a step-by-step logic map for identifying and repairing memory parity failures in the MK11 /MJ11 Memory System.

Key Diagnostic Steps:

- Error ID: Monitor Bit 15 of the Memory System Error Register (MSER).
- Address Capture: Extract physical address from HEAR/LEAR registers
- Diagnostic Execution: Utilize XXDP diagnostics (EKBBE0/EKBBF0).
- Board Swap: Isolate failure to a specific board or slot
